# Calculation Policy 2026-27

St. Gerard's Catholic Primary  
and Nursery School

## Introduction:

This policy is written to serve the requirements of the 2014 National Curriculum. It provides guidance on the appropriate calculation methods and progression. The content is divided into the four main operations: addition, subtraction,

multiplication and division. Pupils should still make connections between different mathematical strands so that they develop fluency and reasoning and problem solving skills.

This Policy is supported a progression document which details the route of progression through the year groups. Children should be given the opportunity to explore the concrete, pictorial and abstract in order to broaden and add depth to their understanding.

St. Gerard's Catholic Primary  
and Nursery School

## AIMS OF THE POLICY:

To ensure consistency and progression in our  
approach to calculation

To ensure that children develop an efficient, reliable, formal written method of calculation for all operations

To ensure that children can use these methods accurately with confidence and understanding

### **Addition:**

#### **Written methods for addition**

It is important that children's mental methods of calculation are practised on a regular basis and secured alongside their learning and use of written methods of addition. The aim is that children use mental methods when appropriate, but for calculations that they cannot do in their heads they use a written method accurately and with confidence. Children are taught and acquire secure mental methods of calculation and one written method of calculation for addition which they know they can rely on when mental methods are not appropriate. This policy shows the possible stages of each written method for addition, each stage building towards a more refined method.

**There are some key basic skills that children need to help with addition, which include:**

- counting

St. Gerard's Catholic Primary  
and Nursery School

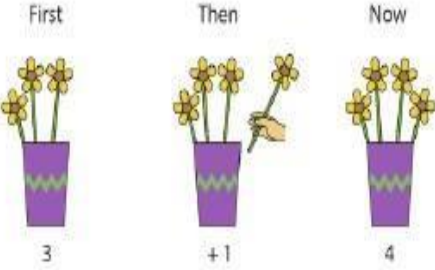

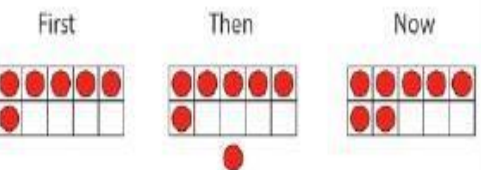

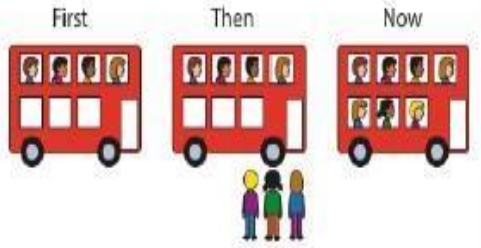

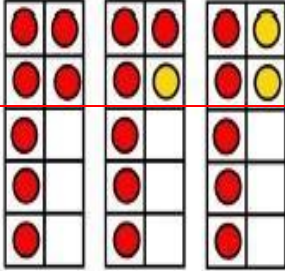

- estimating
- recalling all addition pairs to 10, 20 and 100 ( $7 + 3 = 10$ ,  $17 + 3 = 20$ ,  $70 + 30 = 100$ )
- knowing number facts to 10 ( $6 + 2 = 8$ )
- adding mentally a series of one-digit numbers ( $5 + 8 + 4$ )
- adding multiples of 10 ( $60 + 70$ ) or of 100 ( $600 + 700$ ) using the related addition fact,  $6 + 7$ , and their knowledge of place value
- partitioning two-digit and three-digit numbers into multiples of 100, 10 and 1 in different ways ( $432$  into  $400 + 30 + 2$  and also into  $300 + 120 + 12$ )
- understanding and using addition and subtraction as inverse operations

***Using and applying is a key theme and one of the aims of National Curriculum and before children move onto the next stage in written calculation it is important that their skills are broadened through their use and application in a range of contexts, these include:***

- using inverse
- missing box questions
- using units of measure including money and time
- word problems
- open ended investigations

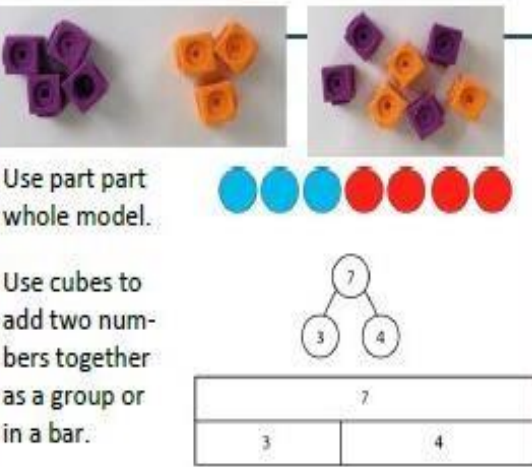

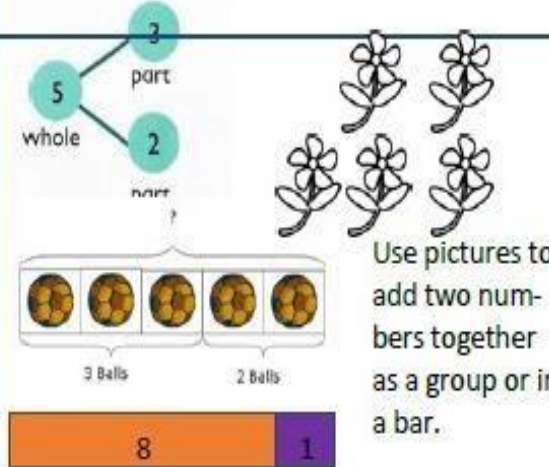

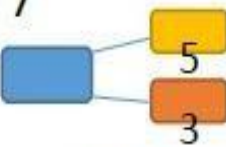

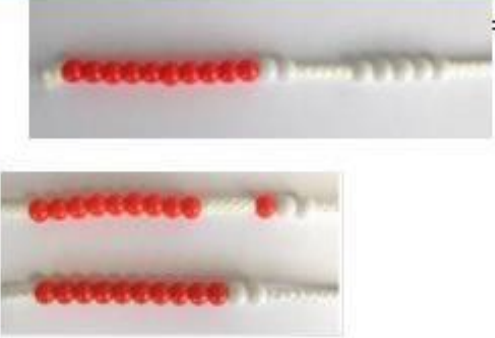

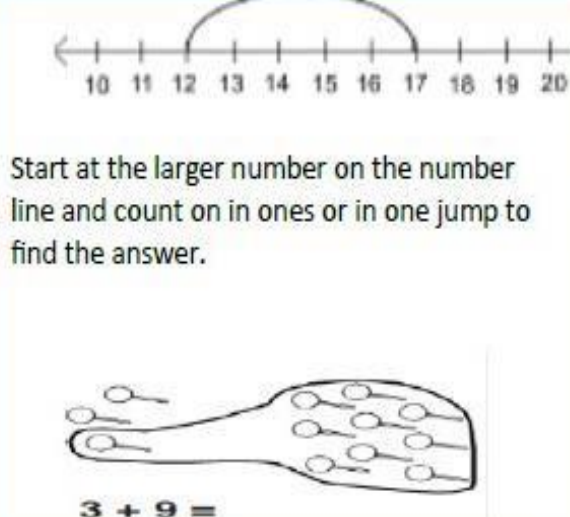

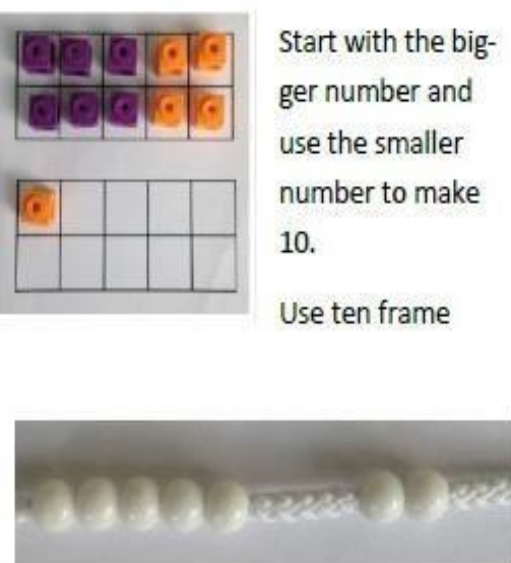

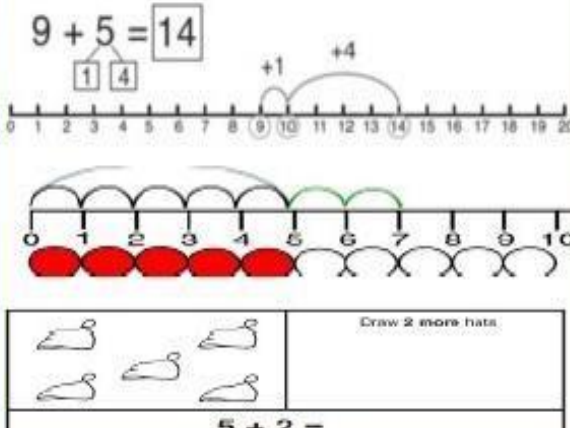

| Objective, Strategy<br>& Key Vocabulary | Concrete                        | Pictorial                                                                             | Abstract |

## **Subtraction:**

### **Written methods for Subtraction**

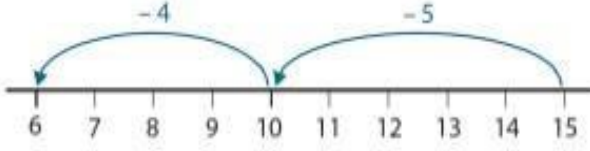

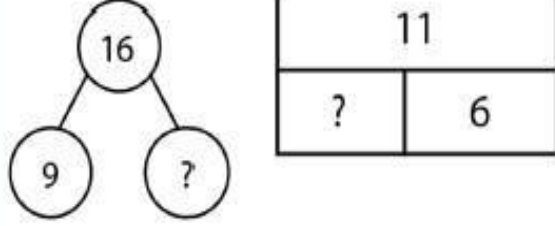

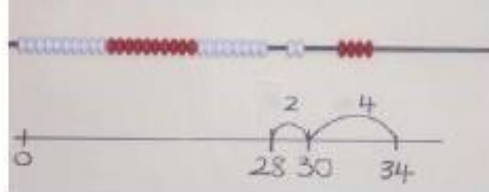

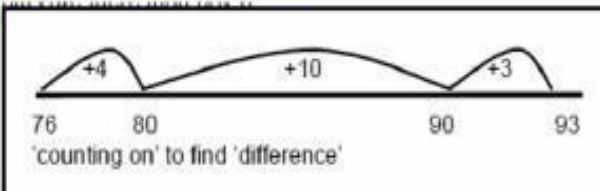

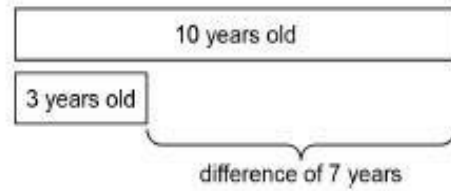

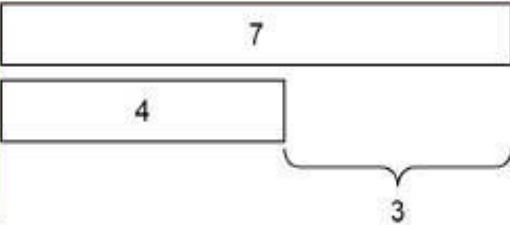

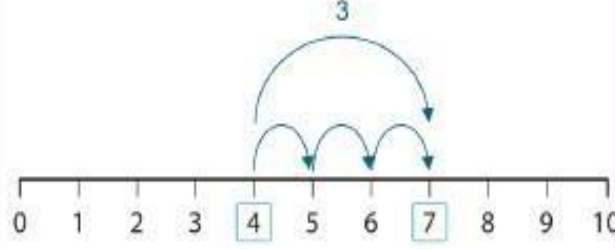

It is important that children's mental methods of calculation are practised on a regular basis and secured alongside their learning and use of written methods of subtraction. The aim is that children use mental methods when appropriate, but for calculations that they cannot do in their heads they use a written method accurately and with confidence. Children are taught and acquire secure mental methods of calculation and one written method of calculation for subtraction which they know they can rely on when mental methods are not appropriate. This policy shows the possible stages of each written method for subtraction, each stage building towards a more refined method.

### **There are some key basic skills that children need to help with subtraction, which include:**

- counting
- estimating
- recalling all addition pairs to 10, 20 and 100 along with their inverses ( $7 + 3 = 10$ ,  $10 - 3 = 7$ ,  $17 + 3 = 20$ ,  $20 - 3 = 17$ ,  $70 + 30 = 100$ ,  $100 - 30 = 70$ )
- knowing number facts to 10 and their inverses ( $6 + 2 = 8$ ,  $8 - 2 = 6$ )
- subtracting multiples of 10 ( $160 - 70$ ) using the related subtraction fact,  $16 - 7$ , and their knowledge of place value
- partitioning two-digit and three-digit numbers into multiples of 100, 10 and 1 in different ways ( $432$  into  $400 + 30 + 2$  and also into  $300 + 120 + 12$ )
- understanding and using subtraction and addition as inverse operations Using and applying is a key theme and one of the aims of National Curriculum and before children move onto the next stage in written calculation it is important that their skills are broadened through their use and application in a range of contexts, these include:
  - using inverse
  - missing box questions
  - using units of measure including money and time
  - word problems
  - open ended investigations

and Nursery School

## **Written methods for Multiplication**

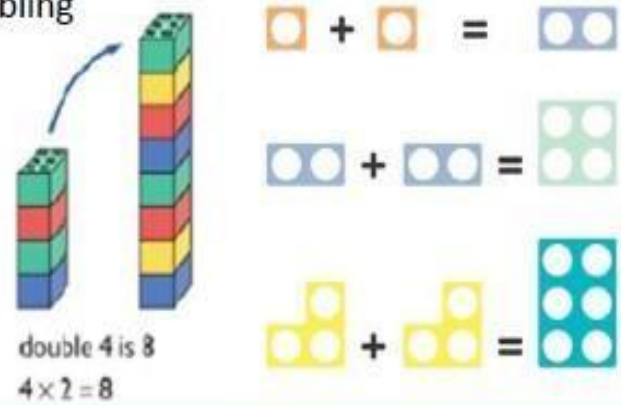

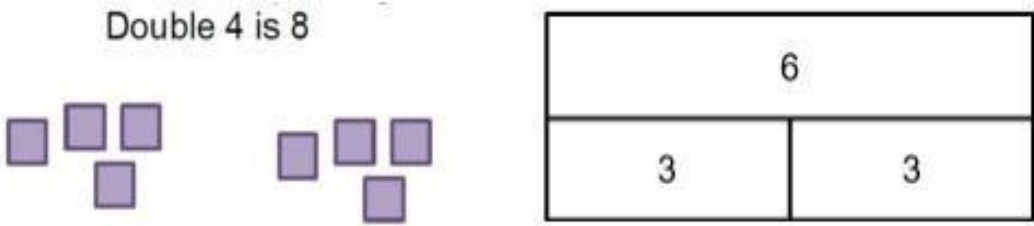

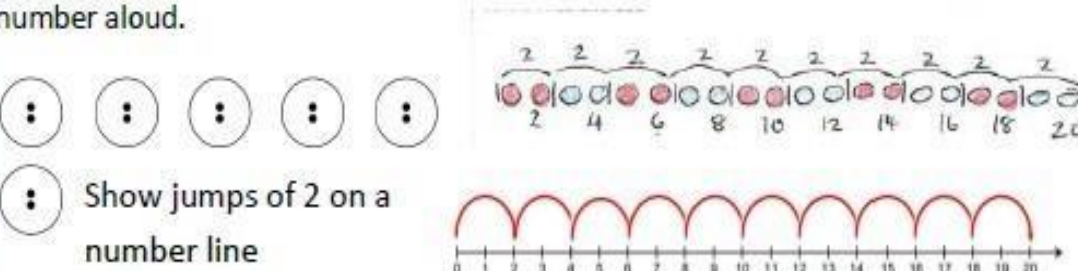

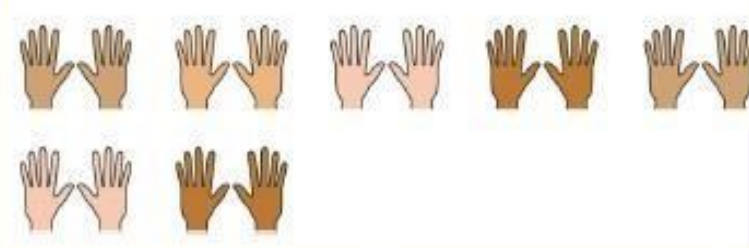

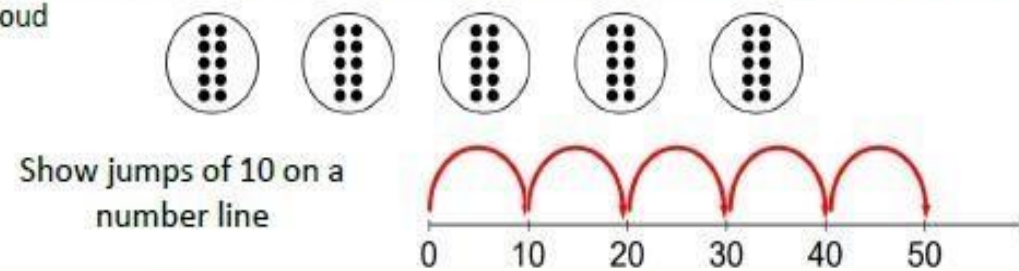

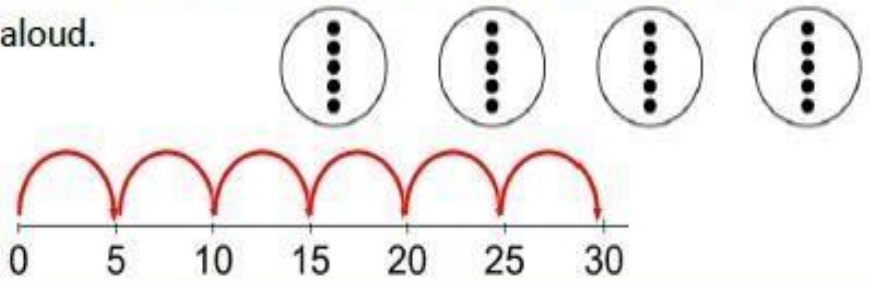

It is important that children's mental methods of calculation are practised on a regular basis and secured alongside their learning and use of written methods of multiplication. The aim is that children use mental methods when appropriate, but for calculations that they cannot do in their heads they use a written method accurately and with confidence. Children are taught and acquire secure mental methods of calculation and one written method of calculation for multiplication which they know they can rely on when mental methods are not appropriate. This policy shows the possible stages of each written method for multiplication, each stage building towards a more refined method.

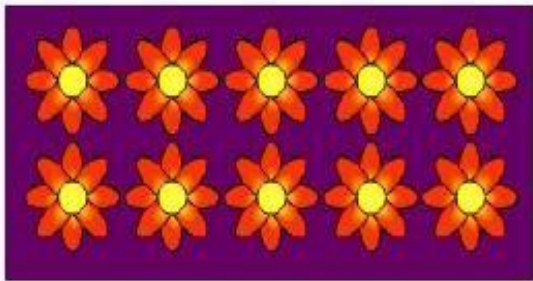

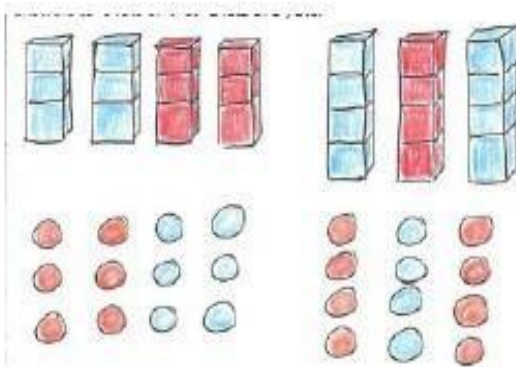

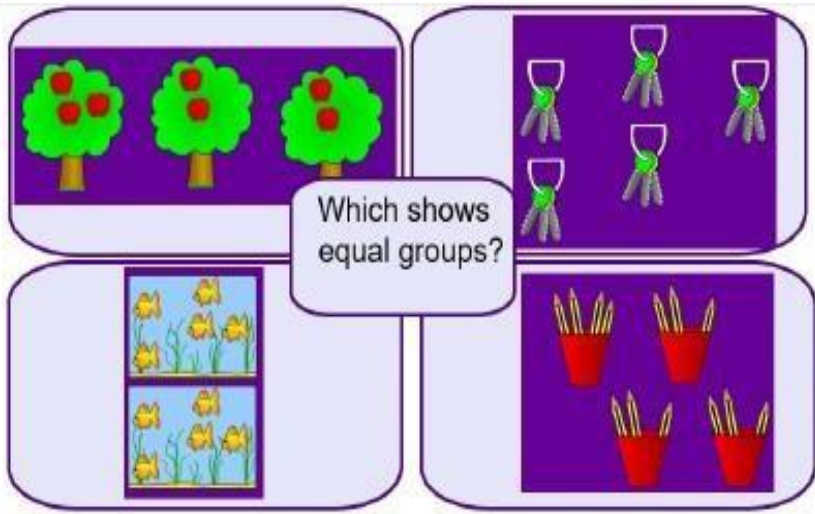

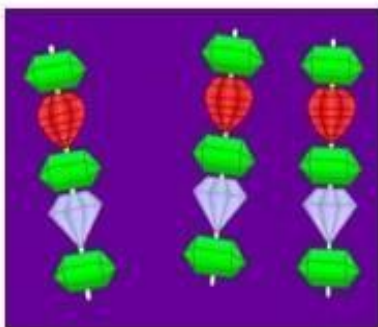

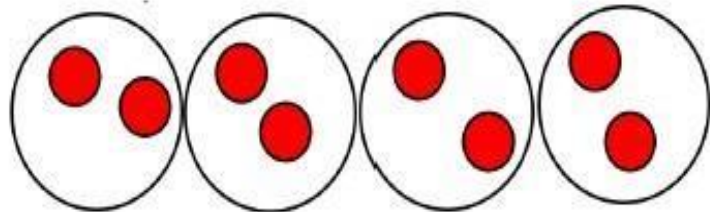

There are some key basic skills that children need to help with multiplication, which include:

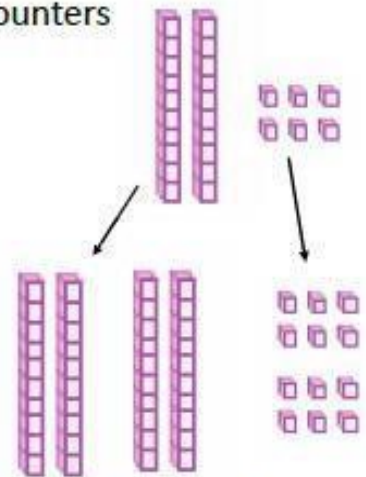

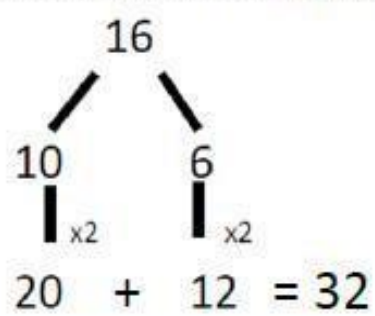

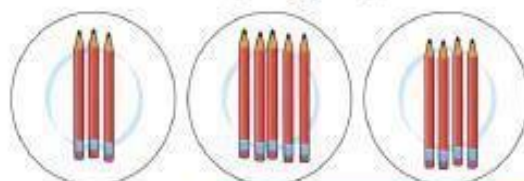

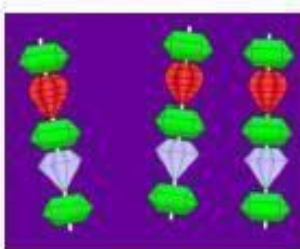

- counting
- estimating
- understanding multiplication as repeated addition
- recalling all multiplication facts to  $12 \times 12$
- partitioning numbers into multiples of one hundred, ten and one
- working out products ( $70 \times 5$ ,  $70 \times 50$ ,  $700 \times 5$ ,  $700 \times 50$ ) using the related fact  $7 \times 5$  and their knowledge of place value
- adding two or more single-digit numbers mentally
- adding multiples of 10 ( $60 + 70$ ) or of 100 ( $600 + 700$ ) using the related addition fact,  $6 + 7$ , and their knowledge of place value • adding combinations of whole numbers
- understanding and using division and multiplication as inverse operations

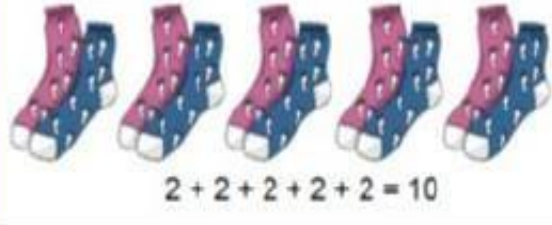

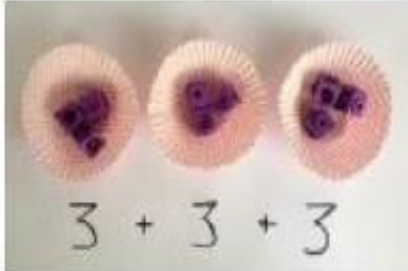

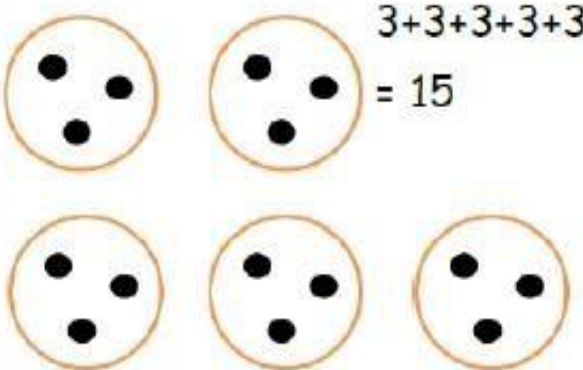

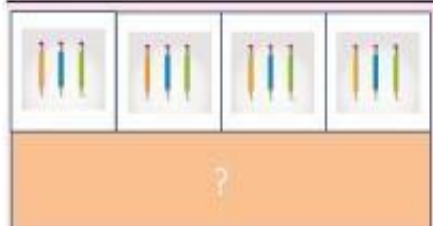

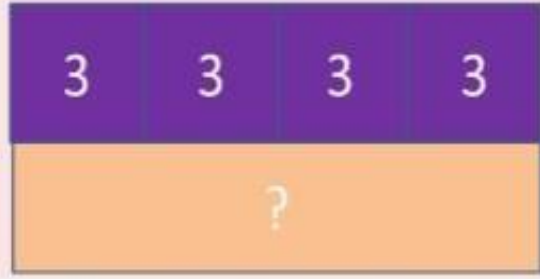

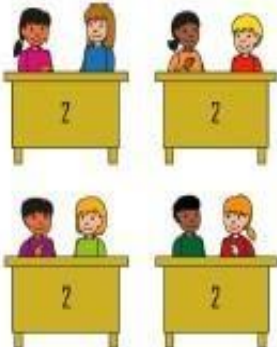

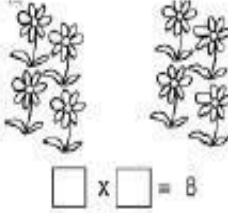

**Using and applying is a key theme and one of the aims of National Curriculum and before children move onto the next stage in written calculation it is important that their skills are broadened through their use and application in a range of contexts, these include:**

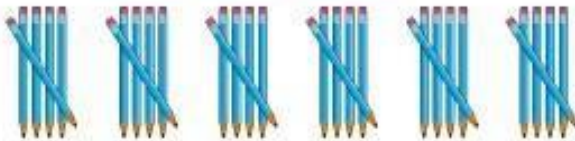

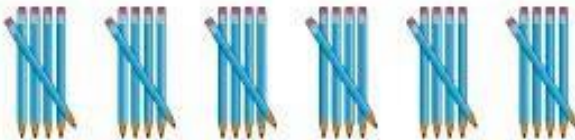

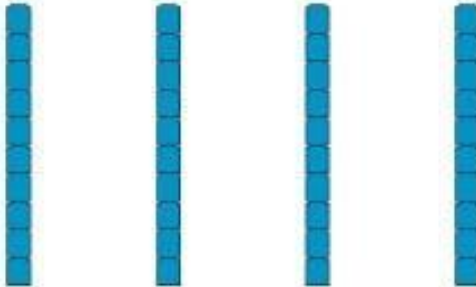

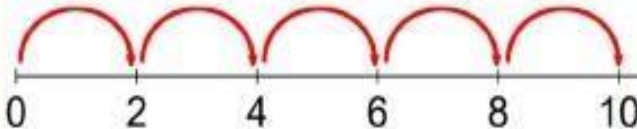

- using inverse
- missing box questions
- using units of measure including money and time
- word problems
- open ended investigations

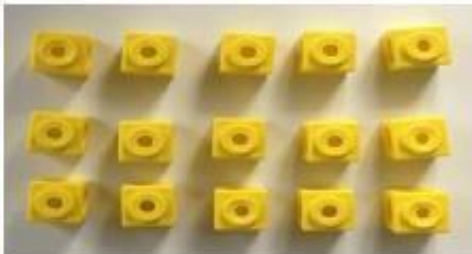

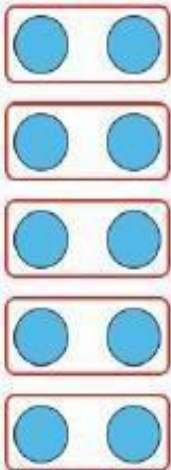

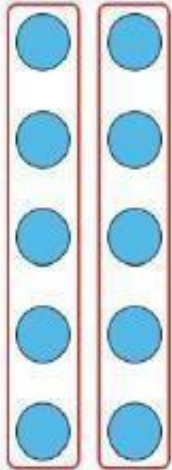

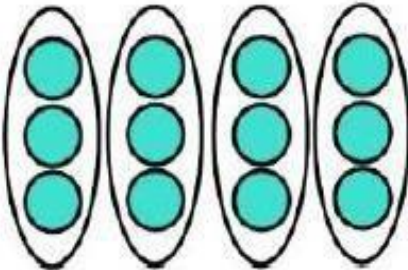

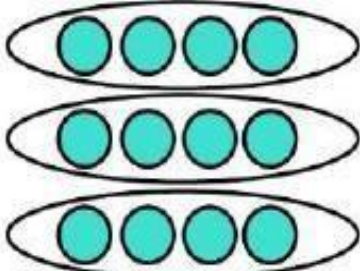

| Objective & Strategy     | Concrete                                                                                                                                                                                                                                    | Pictorial                                                                                                                                                                                                                               |

Written methods for Division

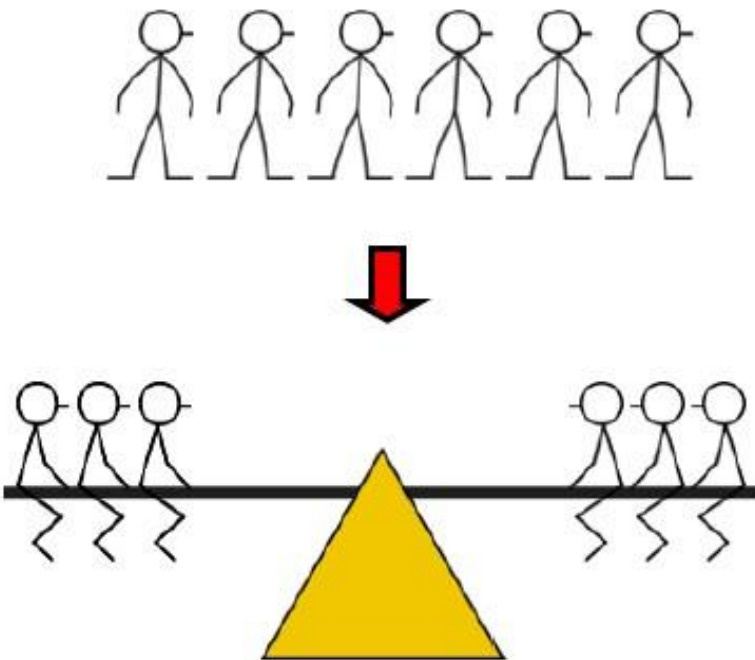

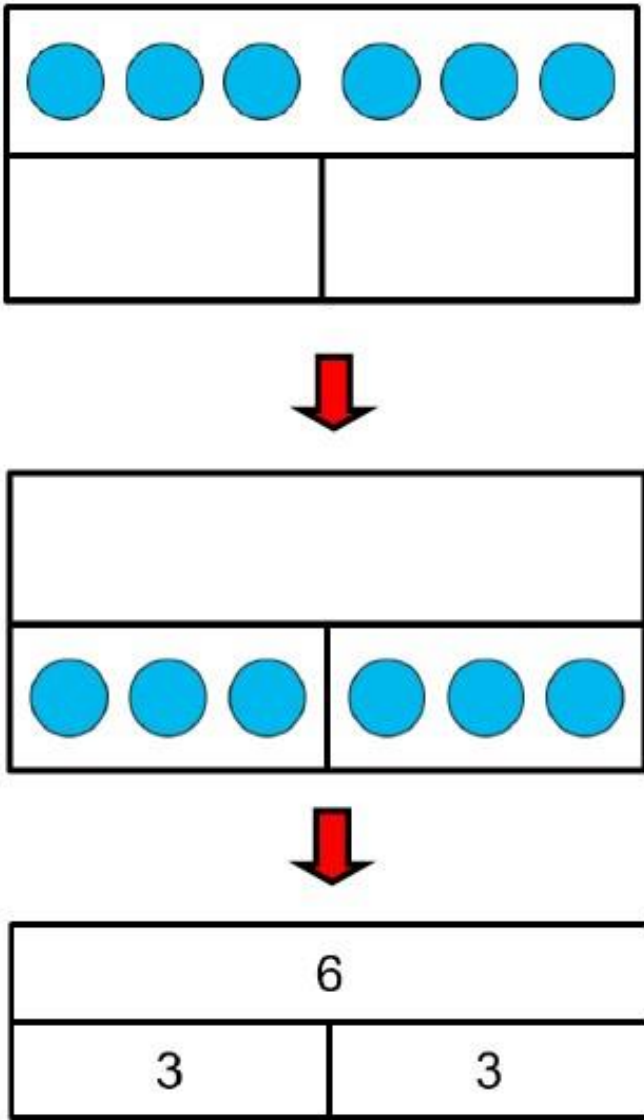

It is important that children's mental methods of calculation are practised on a regular basis and secured alongside their learning and use of written methods of division. The aim is that children use mental methods when appropriate, but for calculations that they cannot do in their heads they use a written method accurately and with confidence. Children are taught and acquire secure mental methods of calculation and one written method of calculation for division which they know they can rely on when mental methods are not appropriate. This policy shows the possible stages of each written method for division, each stage building towards a more refined method.

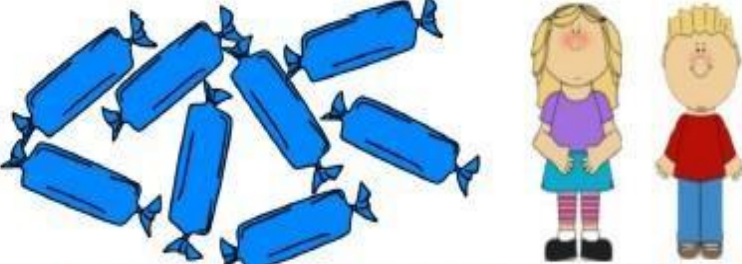

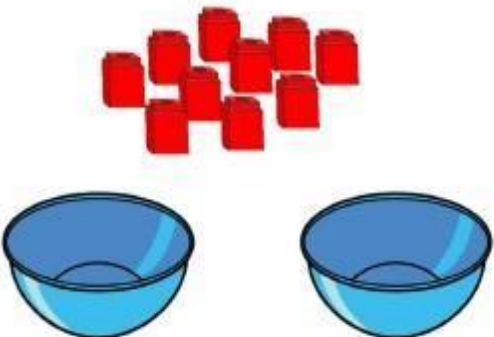

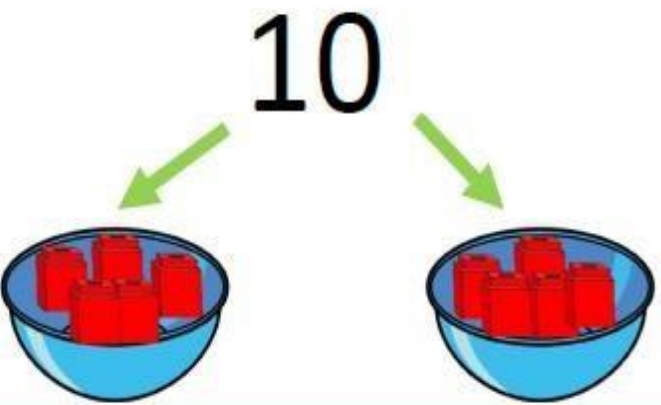

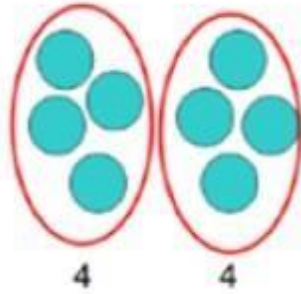

There are some key basic skills that children need to help with subtraction, which include:

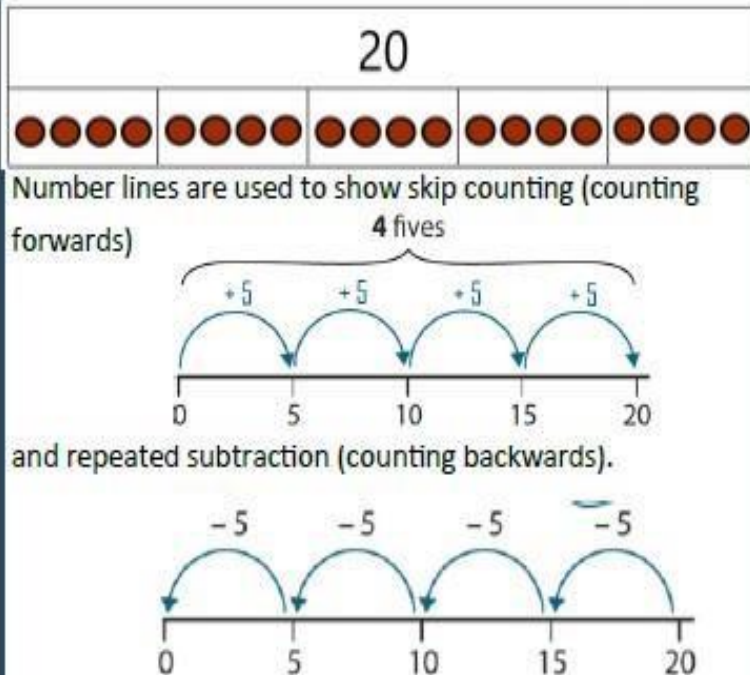

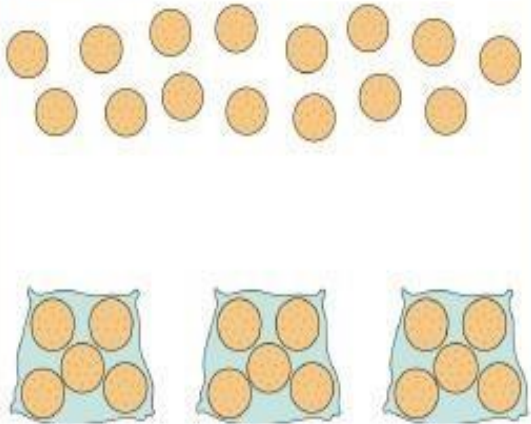

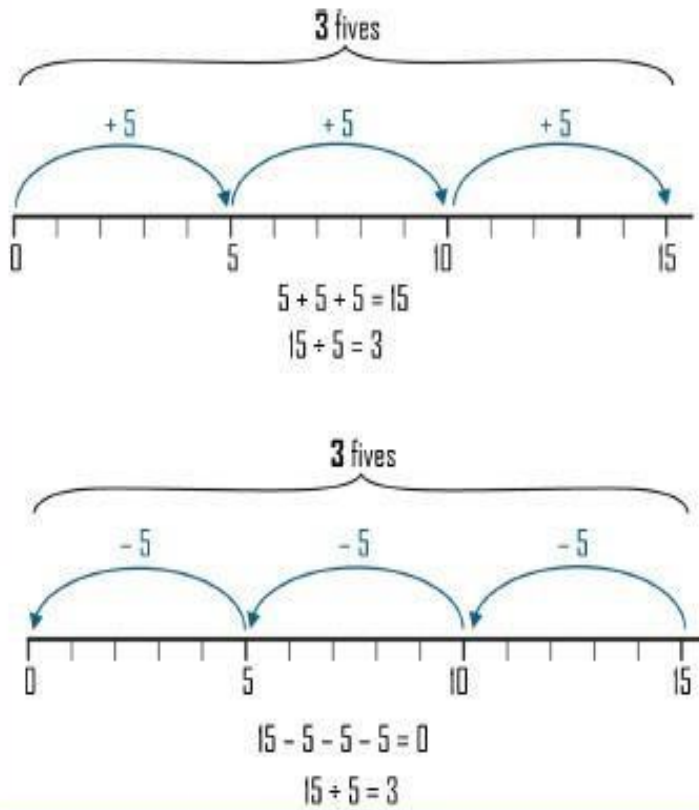

- counting
- estimating
- understanding division as repeated subtraction
- partitioning two-digit and three-digit numbers into multiples of 100, 10 and 1 in different ways (432 into  $400 + 30 + 2$  and also into  $300 + 120 + 12$ )
- recalling multiplication and division facts to  $12 \times 12$
- recognising multiples of one-digit numbers and dividing multiples of 10 or 100 by a single-digit number using their knowledge of division facts and place value
- knowing how to find a remainder working mentally, for example, find the remainder when 48 is divided by 5
- understanding and using division and multiplication as inverse operations

**Using and applying is a key theme and one of the aims of National Curriculum and before children move onto the next stage in written calculation it is important that their skills are broadened through their use and application in a range of contexts, these include:**

- using inverse
- missing box questions
- using units of measure including money and time
- word problems
- open ended investigations

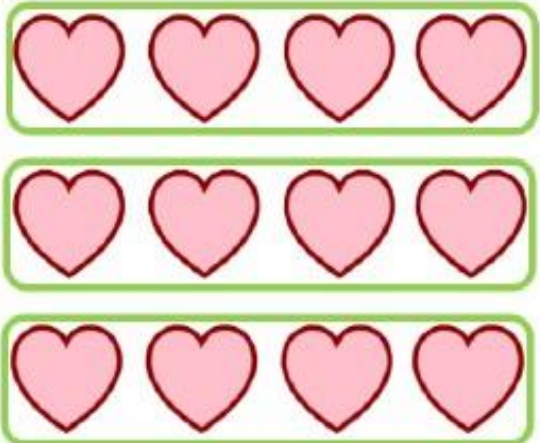

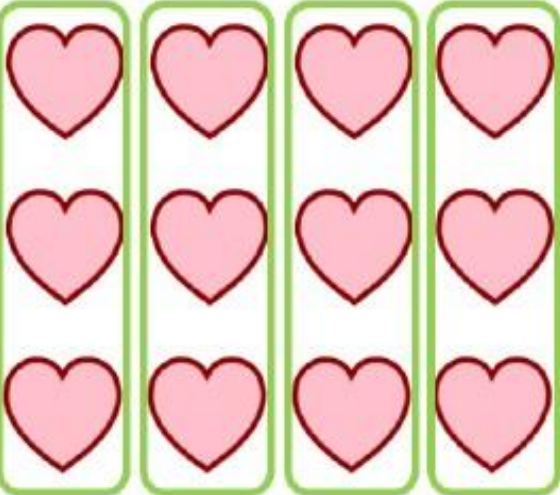

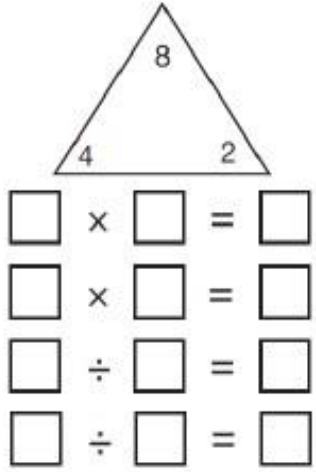

| Objective & Strategy        | Concrete                                                                                                                                                                                                                                                                                                                                                                                                                            | Pictorial                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Find half of numbers to 20. | <p>Real life and practical contexts are used to find half of numbers up to 20.</p>  <p>The diagram shows six stick figures in a row. A red arrow points down to a balance scale. On the left pan, three stick figures are placed. On the right pan, three stick figures are placed. The scale is balanced, illustrating that half of 6 is 3.</p> | <p>Children use manipulatives to represent real life problems.</p>  <p>The diagram shows a ten-frame divided into two rows. The top row contains six blue circles. A red arrow points down to the same ten-frame, but now the six blue circles are split between the two rows: three in the top row and three in the bottom row. Another red arrow points down to a final ten-frame where the top row is labeled '6' and the bottom row is split into two sections, each labeled '3', illustrating that half of 6 is 3.</p> <p>half of 6 = 3<br/>double 3 = 6</p> |

## Divisibility rules in 'families' – 3, 6 and 9

|          |                                                                                                |
|----------|------------------------------------------------------------------------------------------------|
| <b>3</b> | For a number to be divisible by 3, the sum of the digits of the number must be divisible by 3. |
| <b>6</b> | For a number to be divisible by 6, the number must be divisible by <i>both 2 and 3</i> .       |
| <b>9</b> | For a number to be divisible by 9, the sum of the digits of the number must be divisible by 9. |

## Divisibility rules in 'families' – 5 and 10

|           |                                                         |
|-----------|---------------------------------------------------------|
| <b>5</b>  | A number is divisible by 5 if the ones digit is 5 or 0. |
| <b>10</b> | A number is divisible by 10 if the ones digit is 0.     |

## Division of 2 digits by 2 digits

Using  $\times$  &  $\div$  by 10, 100 etc and relating this to a short division method.

$$\begin{array}{ccccc} 60 & \div & 30 & = & \boxed{2} \\ \div 10 \downarrow & & \downarrow 10 \div & & \uparrow \\ 6 & \div & 3 & = & 2 \end{array}$$

$$\begin{array}{r} 0 \quad 2 \\ 30 \overline{) 6 \quad 60} \end{array}$$

Y5

DIVISION  $\div$

## Long Division—2 digits divided by 2 digits

H T O

$$\begin{array}{r} 30 \overline{) 85} \end{array}$$

30 does not go into 8.  
So, combine the 8  
tens with the 5 ones.

H T O

$$\begin{array}{r} 2 \\ 30 \overline{) 85} \\ \underline{60} \end{array}$$

30 goes into 85 twice,  
which is 60.

H T O

$$\begin{array}{r} 2 \\ 30 \overline{) 85} \\ \underline{60} \\ 25 \end{array}$$

Subtract the 60 from  
the 85 and this leaves  
25.

H T O

$$\begin{array}{r} 2 \text{ r } 25 \\ 30 \overline{) 85} \\ \underline{60} \\ 25 \end{array}$$

85 divided by 30 is 2  
with a remainder of  
25

Y6

DIVISION ÷

## Long Division—3 digits divided by 2 digits

$$\begin{array}{r}
 \text{H} \quad \text{T} \quad \text{O} \\
 31 \overline{) 4 \quad 3 \quad 4}
 \end{array}
 \rightarrow
 \begin{array}{r}
 \text{H} \quad \text{T} \quad \text{O} \\
 0 \quad \phantom{0} \\
 31 \overline{) 4 \quad 3 \quad 4}
 \end{array}
 \rightarrow
 \begin{array}{r}
 \text{H} \quad \text{T} \quad \text{O} \\
 0 \quad 1 \phantom{0} \\
 31 \overline{) 4 \quad 3 \quad 4} \\
 \underline{3 \quad 1} \phantom{0}
 \end{array}
 \rightarrow
 \begin{array}{r}
 \text{H} \quad \text{T} \quad \text{O} \\
 0 \quad 1 \phantom{0} \\
 31 \overline{) 4 \quad 3 \quad 4} \\
 \underline{3 \quad 1} \phantom{0} \\
 1 \quad 2 \phantom{0}
 \end{array}$$

31 does not go into 4 (hundreds).

We combine the 4 hundreds with the tens to give 43 tens. 31 goes into 43 once which is 31, we record this underneath.

Subtract to find the remainder. 31 from 43 leaves 12.

$$\begin{array}{r}
 \text{H} \quad \text{T} \quad \text{O} \\
 0 \quad 1 \phantom{0} \\
 31 \overline{) 4 \quad 3 \quad 4} \\
 \underline{3 \quad 1} \phantom{0} \\
 1 \quad 2 \quad 4
 \end{array}
 \rightarrow
 \begin{array}{r}
 \text{H} \quad \text{T} \quad \text{O} \\
 0 \quad 1 \phantom{0} \\
 31 \overline{) 4 \quad 3 \quad 4} \\
 \underline{3 \quad 1} \phantom{0} \\
 1 \quad 2 \quad 4 \\
 \underline{1 \quad 2 \quad 4}
 \end{array}
 \rightarrow
 \begin{array}{r}
 \text{H} \quad \text{T} \quad \text{O} \\
 0 \quad 1 \quad 4 \\
 31 \overline{) 4 \quad 3 \quad 4} \\
 \underline{3 \quad 1} \phantom{0} \\
 1 \quad 2 \quad 4 \\
 \underline{1 \quad 2 \quad 4} \\
 0
 \end{array}$$

We combine 12 with the next digit to give 124.

31 goes into 124 four times, which is 124.

We subtract to show there is no remainder

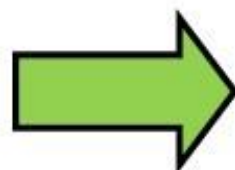

# Y6

# DIVISION ÷

## Long Division—progressing to 4 or more digits

Y6

$$\begin{array}{r} \text{TH} \quad \text{H} \quad \text{T} \quad \text{O} \\ 23 \overline{) 4945} \end{array}$$

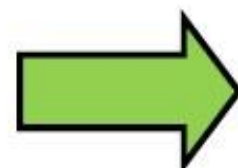

$$\begin{array}{r} \text{TH} \quad \text{H} \quad \text{T} \quad \text{O} \\ 2 \\ 23 \overline{) 4945} \\ \underline{46} \phantom{0} \\ 3 \phantom{0} \end{array}$$

$$\begin{array}{r} \text{TH} \quad \text{H} \quad \text{T} \quad \text{O} \\ 2 \quad 1 \\ 23 \overline{) 4945} \\ \underline{46} \phantom{0} \\ 34 \\ \underline{23} \phantom{0} \\ 11 \phantom{0} \end{array}$$

23 goes into 49 twice which is 46. We subtract this from 49 to give a remainder of 3.

We combine the 3 left over with the next digit to give 34. 23 goes into 34 once with 11 remaining.

$$\begin{array}{r} \text{TH} \quad \text{H} \quad \text{T} \quad \text{O} \\ 2 \quad 1 \quad 5 \\ 23 \overline{) 4945} \\ \underline{46} \phantom{0} \\ 34 \\ \underline{23} \phantom{0} \\ 115 \\ \underline{115} \\ 0 \end{array}$$

We combine the 11 with the next digit to make 115. 23 goes into 115 5 times with no remainder.
